Qid	validation_statement
Q10_1	Climate variation is normal, so why should this be a problem?
Q10_2	Climate change will not be a problem because there will be technological solutions available.
Q10_3	I think it is safe to say climate change is here.
Q10_4	The negative effects of climate change on local commerce should be taken into account.
Q10_5	I do not trust what scientists say about climate change.
Q10_6	I do not trust what I hear about climate change from the government.
Q10_7	It is difficult to trust what comes out in the media on the issue of climate change.
Q10_8	There is not enough information to definitively say that climate change is real.
Q20_1	There is not much point in me doing anything to make agriculture more sustainable. No one else is going to.
Q20_2	I do not know what to do. I am very concerned and would like to do something, but I donâ€™t have a realistic shortlist of things that would really make a difference.
Q20_3	I believe that the difference we can have as an individual, in Switzerland, is so minimal that our actions are worthless.
Q20_4	I am not going to do anything to address the impacts of the agri-food system because it is not a major issue.
Q30_1	I am happy to pay a higher price for local or organic food products
Q30_2	Eating sustainably is too expensive, and only wealthy people can afford it
Q30_3	Agricultural subsidies should promote sustainable, pesticide and antibiotic-free production.
Q30_4	Sustainable agriculture increases prices and harms consumer freedom. The production should be adapted to what people demand.
Q30_5	Food accessibility (price) and security (availability) is NOT COMPATIBLE with a sustainable food system
Q30_6	Strong regulation of food production will eventually damage our economic relationship with other countries
Q30_7	We should develop short distribution channels and support local production instead of supporting big agrifood corporations

Q30_8	We need to focus on adaptation actions that are concerned with the economic future of the country.
Q40_1	Actions on the food system in Switzerland will lead to increased imports and a shift of pollution abroad
Q40_2	We need actions to protect inhabitants and biodiversity from harmful pesticides.
Q40_3	As long as we use animals in agriculture, it cannot be sustainable
Q40_4	We need to deal with the water pollution issue through measures such as reducing fertilizer and pesticide use.
Q50_1	Banning pesticides might help the local biodiversity but decreases our food production capacity and autonomy
Q50_2	Agriculture is already very sustainable. Swiss farmers are on the right track
Q50_3	Intensive food production can go along with the protection of the environment and health
Q50_4	Farmers already suffer enough from strict rules and paperwork. Family farmers should have more liberties
Q50_5	The main focus of planning for adaptation should be to prepare the food system for extreme weather events, such as drought and flooding.
Q50_6	Products that use environmentally harmful ingredients, such as palm oil, should be taxed in the same way as tobacco products.
Q50_7	If Switzerland reduces greenhouse gas emissions in its food system, it wonâ€™t make a difference.
Q60_1	It is important to plan for migration by people displaced by malnutrition and famine.
Q60_2	We should focus on protecting human systems rather than environmental ecosystems.
Q60_3	The Swiss food system depends on imports from other countries, and it is in our interest to help find an effective global solution.
Q60_4	Some communities are more affected than others by the global agri-food system, but this is not a priority issue.
Q60_5	The Swiss food system is particularly vulnerable to climate change, and it is in our interest to help find an effective global solution.
Q60_6	Climate warming will ultimately benefit food production globally as plants better growth in higher temperature
Q70_1	It is NOT necessary to engage with the community when deciding what are the most important issues for planning for food system changes.

Q70_2	Planning for food system adaptation needs a holistic approach, considering a whole range of issues, instead of focusing on individual issues.
Q70_3	There is no urgent need to prepare for an increase in illness and death caused by intensive use of pesticides/antibiotics
Q70_4	The community should be involved in discussions about food system adaptation.

1st_closest_statement	1st_closes
The reality of climate change necessitates a shift in agricultural practices without compromising productivity.	1
Global climate change requires local solutions, but these must be economically viable for farmers and consumers alike.	1
Climate change policies should recognize the balance between environmental sustainability and the economic realities faced by farmers.	1
Global climate change requires local solutions, but these must be economically viable for farmers and consumers alike.	1
We must improve our food waste strategies to ensure that edible food doesn't contribute to climate change.	2
Climate change is a significant threat that is affecting our food security and agriculture in Switzerland.	1
Public discourse on food systems must prioritize human health and economic stability over environmental concerns that may not have immediate local impacts.	4
The reality of climate change necessitates a shift in agricultural practices without compromising productivity.	1
Increasing the self-sufficiency of the domestic food supply is essential, but it must not lead to overregulation of the agricultural sector.	0
We need to transition towards more sustainable food consumption patterns to address the realities of climate change.	1
The balance between environmental considerations and food production is crucial; without it, the sustainability of the Swiss food system may be compromised.	5
The government should ensure that agricultural practices do not compromise food security and affordability for the citizens.	2
I am willing to pay more for local agriculture to support sustainable farming practices.	5
The public should not be forced to adopt dietary restrictions; consumer choice should drive sustainable practices.	1
Investments in ecological farming methods should be prioritized over subsidies for conventional agriculture.	5
We should prioritize growing crops for human consumption instead of animal feed to improve our self-sufficiency in food production.	0
Public discourse on food systems must prioritize human health and economic stability over environmental concerns that may not have immediate local impacts.	4
Import restrictions may protect local farmers, but they also risk increasing food prices for consumers.	3
Local food production should be prioritized to minimize the ecological footprint of our food systems.	4

Local, sustainable agricultural practices are crucial for adapting to the realities of climate change.	1
It is crucial to promote local food systems in Switzerland to reduce dependency on imported goods and enhance food sovereignty.	6
The reduction of chemical fertilizers and pesticides is essential for preserving our natural ecosystems.	4
We should prioritize growing crops for human consumption instead of animal feed to improve our self-sufficiency in food production.	0
Sustainable agricultural practices must be implemented to mitigate harmful effects on our water systems and to reduce the biodiversity crisis.	4
The over-reliance on synthetic fertilizers and pesticides should be reduced to promote healthier ecosystems and food systems.	5
Sustainable agriculture practices must prioritize the economic viability of Swiss farmers to ensure they can compete in an increasingly globalized market.	5
Investments in sustainable agricultural practices can enhance both food security and environmental health.	3
We must collectively advocate for regulations that protect both farmers and the environment in our food system.	2
Public awareness of the climate crisis and its connection to food systems is vital for creating sustainable dietary habits.	1
It is essential that imported food products meet the same standards as domestic products to ensure fairness for local farmers.	2
The balance between environmental considerations and food production is crucial; without it, the sustainability of the Swiss food system may be compromised.	5
We need to transition towards more sustainable food consumption patterns to address the realities of climate change.	1
Public discourse on food systems must prioritize human health and economic stability over environmental concerns that may not have immediate local impacts.	4
We should prioritize our food imports to ensure they meet Swiss agricultural standards.	6
Increasing the self-sufficiency of the domestic food supply is essential, but it must not lead to overregulation of the agricultural sector.	0
It is essential to recognize that climate change poses a significant threat to our food security in Switzerland.	1
Local and organic food production should be prioritized to enhance resilience against climate change.	1
The government should ensure that agricultural practices do not compromise food security and affordability for the citizens.	2

We must transition to a food system that prioritizes plant-based diets over meat consumption to increase sustainability.	5
Increasing the self-sufficiency of the domestic food supply is essential, but it must not lead to overregulation of the agricultural sector.	0
Public awareness of the environmental impact of our food choices is crucial to promote a more responsible and sustainable food system.	4

Global climate change requires local solutions, but these must be economically viable for farmers and consumers alike.	1
Climate change policies should recognize the balance between environmental sustainability and the economic realities faced by farmers.	1
Efforts to address climate change must consider economic viability and food security for local farmers.	1
Local, sustainable agricultural practices are crucial for adapting to the realities of climate change.	1
We need to recognize that increasing temperatures and extreme weather conditions are making it more difficult to grow essential food crops.	1
We must improve our food waste strategies to ensure that edible food doesn't contribute to climate change.	2
We need to transition towards more sustainable food consumption patterns to address the realities of climate change.	1
We need to recognize that increasing temperatures and extreme weather conditions are making it more difficult to grow essential food crops.	1
Government regulations on farming should not hinder the existing agricultural systems that already balance productivity and ecological health.	4
We need to transition towards sustainable agricultural practices to protect biodiversity and reduce pollution.	4
Proactive measures are needed to maintain the competitiveness of Swiss agriculture against cheaper imports.	3
Government regulations on farming should not hinder the existing agricultural systems that already balance productivity and ecological health.	4
I believe that investing in organic farming will lead to healthier food options and support local economies.	0
Public policy should focus on educating consumers about sustainable eating habits and the impact of their food choices.	0
The government should provide incentives for sustainable agricultural practices that also promote profitability.	3
We should aim to significantly increase the share of organic and sustainable farming in our food production to protect biodiversity and public health.	6
The balance between environmental considerations and food production is crucial; without it, the sustainability of the Swiss food system may be compromised.	5
Policies aimed at regulating food imports must consider the environmental and social impacts of industrial agriculture.	6
Investing in innovative agricultural technologies can enhance productivity while minimizing resource use, benefiting both local farmers and global markets.	6

We need to adopt agricultural practices that prioritize resilience against climate change and support sustainable development globally.	6
Relying heavily on food imports presents risks to Switzerland's food security, necessitating a more strategic approach to domestic agriculture.	6
We should strengthen regulations to reduce pesticide use in order to protect biodiversity in Swiss agriculture.	4
We must avoid increasing pollution levels caused by intensive farming methods while ensuring the sustainability of our food system.	4
Efforts to reduce pollution in agriculture should focus on incentivizing farmers rather than imposing stringent regulations that could threaten their livelihoods.	4
We should prioritize local food production, as this significantly reduces our overall ecological footprint.	1
The Swiss economy relies on a strong agricultural sector, which must maintain productivity while emphasizing eco-friendly practices.	5
Investments in ecological agriculture are crucial for future food security and environmental health.	2
Swiss farmers already operate under stringent regulations, and additional restrictions could jeopardize their livelihoods.	0
We need to recognize that increasing temperatures and extreme weather conditions are making it more difficult to grow essential food crops.	1
Environmental costs associated with food production must be addressed through market mechanisms rather than government regulations.	7
A shift towards more plant-based diets can help Switzerland reduce its ecological footprint and improve global food distribution.	6
Efforts to address climate change must consider economic viability and food security for local farmers.	1
Regulations should focus on promoting biodiversity and sustainable practices in agriculture, rather than solely increasing production.	3
It is crucial to promote local food systems in Switzerland to reduce dependency on imported goods and enhance food sovereignty.	6
Public discourse on food systems must prioritize human health and economic stability over environmental concerns that may not have immediate local impacts.	4
The Swiss food system significantly contributes to climate change and must evolve to mitigate its impact.	1
Efforts to address climate change must consider economic viability and food security for local farmers.	1
Consumer choice should dictate the food market, without unnecessary governmental interference in agricultural practices.	0

A comprehensive approach to food policy is needed, addressing not only agricultural practices but also consumer behavior and food distribution.	7
Government regulations on farming should not hinder the existing agricultural systems that already balance productivity and ecological health.	4
Public awareness of the climate crisis and its connection to food systems is vital for creating sustainable dietary habits.	1

Climate change policies should recognize the balance between environmental sustainability and the economic realities faced by farmers.	1
Investing in sustainable farming practices is essential to ensure that agriculture does not harm our natural ecosystems.	4
It is essential to recognize that climate change poses a significant threat to our food security in Switzerland.	1
Local and seasonal food options can reduce the carbon footprint associated with food production and transportation.	1
The reality of climate change necessitates a shift in agricultural practices without compromising productivity.	1
The reality of climate change necessitates a shift in agricultural practices without compromising productivity.	1
It is essential to recognize that climate change poses a significant threat to our food security in Switzerland.	1
We need to transition towards more sustainable food consumption patterns to address the realities of climate change.	1
Farmers have a responsibility to produce food sustainably without relying overly on government support.	2
We must improve our food waste strategies to ensure that edible food doesn't contribute to climate change.	2
A shift towards more plant-based diets can help Switzerland reduce its ecological footprint and improve global food distribution.	6
Investing in sustainable farming practices is essential to ensure that agriculture does not harm our natural ecosystems.	4
Consumer preferences should shift towards more locally produced, organic food to support sustainable agricultural practices.	5
Environmental costs associated with food production must be addressed through market mechanisms rather than government regulations.	7
Investments in sustainable agricultural practices can enhance both food security and environmental health.	3
Consumer awareness and demand for environmentally-friendly products should guide agricultural policies and practices.	3
Our food systems must prioritize resilience to climate change to ensure future food security in Switzerland.	1
We should prioritize increasing local food production to enhance our food sovereignty and reduce dependence on imports.	3
We should prioritize increasing local food production to enhance our food sovereignty and reduce dependence on imports.	3

We need to transition towards more sustainable food consumption patterns to address the realities of climate change.	1
We should prioritize our food imports to ensure they meet Swiss agricultural standards.	6
The excessive use of fertilizers and pesticides in conventional farming leads to significant pollution and threatens biodiversity.	4
We should prioritize the cultivation of crops for human consumption over animal feed to reduce environmental impacts and enhance food sustainability.	4
Reducing reliance on chemical inputs in agriculture can benefit both the environment and human health.	5
Supporting local agriculture can effectively reduce our reliance on environmentally damaging imports, thereby protecting our ecosystems.	4
Strengthening local organic farming is essential for Switzerland to achieve both self-sufficiency and sustainability.	6
Investments in technological advancements for food production can lead to both economic growth and environmental benefits.	0
The transition to sustainable farming practices must be balanced with economic viability for farmers.	0
Our food systems must prioritize resilience to climate change to ensure future food security in Switzerland.	1
There is a necessity for clearer labeling on food products to inform consumers about their environmental impact.	4
Switzerland needs to invest in sustainable agricultural practices to mitigate the effects of climate change on food production.	1
We must transition to a food system that prioritizes plant-based diets over meat consumption to increase sustainability.	5
Environmental costs associated with food production must be addressed through market mechanisms rather than government regulations.	7
The Swiss food system should focus on strengthening local production to ensure food security in an increasingly globalized world.	6
The government should ensure that agricultural practices do not compromise food security and affordability for the citizens.	2
Climate change is a significant threat that is affecting our food security and agriculture in Switzerland.	1
Investments in technological advancements for food production can lead to both economic growth and environmental benefits.	0
The public should not be forced to adopt dietary restrictions; consumer choice should drive sustainable practices.	1

Public discourse on food systems must prioritize human health and economic stability over environmental concerns that may not have immediate local impacts.	4
Reducing reliance on chemical inputs in agriculture can benefit both the environment and human health.	5
Public policy should focus on educating consumers about sustainable eating habits and the impact of their food choices.	0

Global climate change requires local solutions, but these must be economically viable for farmers and consumers alike.	1
Investing in sustainable farming practices is essential to ensure that agriculture does not harm our natural ecosystems.	4
Local, sustainable agricultural practices are crucial for adapting to the realities of climate change.	1
Government regulations concerning food imports need to ensure that they do not compromise the quality of local Swiss products.	7
Increasing the self-sufficiency of the domestic food supply is essential, but it must not lead to overregulation of the agricultural sector.	0
Support fair pricing for local farmers, which would ensure the sustainability of the agricultural sector.	3
Increasing the self-sufficiency of the domestic food supply is essential, but it must not lead to overregulation of the agricultural sector.	0
Public policies should focus on supporting farmers to adopt sustainable practices without imposing burdensome regulations.	7
Consumers play a crucial role in supporting sustainable agriculture by choosing local and seasonal products.	5
Environmental costs associated with food production must be addressed through market mechanisms rather than government regulations.	7
We must prioritize the production of local, sustainable food to ensure our food sovereignty.	2
Promotion of local food products can drive economic growth while reducing dependency on imports.	3

The transition to sustainable farming practices must be balanced with economic viability for farmers.	0
The future of Switzerland's food system depends on a significant shift toward plant-based diets, which could enhance our self-sufficiency.	3
We need to transition towards sustainable agricultural practices to protect biodiversity and reduce pollution.	4
The excessive use of fertilizers and pesticides in conventional farming leads to significant pollution and threatens biodiversity.	4
The reduction of chemical fertilizers and pesticides is essential for preserving our natural ecosystems.	4
Local food production should be prioritized to minimize the ecological footprint of our food systems.	4
Modern agricultural methods should be embraced to ensure sustainable food production in Switzerland.	5
We need to ensure that a significant portion of our food is produced domestically to bolster food security.	7
The state must limit excessive regulation to allow farmers the freedom to innovate and respond to market demands.	2
We need to transition towards more sustainable food consumption patterns to address the realities of climate change.	1
The government should enforce stricter regulations on food imports to ensure sustainability and ethical practices.	2
Encouraging the import of sustainably produced food could help Switzerland meet its environmental goals without compromising local agricultural viability.	6
Public awareness of the climate crisis and its connection to food systems is vital for creating sustainable dietary habits.	1
Sustainable agricultural practices must be implemented to mitigate harmful effects on our water systems and to reduce the biodiversity crisis.	4
Addressing global food challenges requires collaborative efforts between Swiss stakeholders and international partners to improve food systems worldwide.	6
It is essential to promote local agricultural production to ensure national food security amidst global uncertainties.	0
Climate change poses substantial risks to Switzerland's agricultural production and food security.	1
Investment in innovative agricultural technologies is essential for adapting to climate challenges and ensuring food security.	5
Public discourse on food systems must prioritize human health and economic stability over environmental concerns that may not have immediate local impacts.	4

Collaboration among farmers, consumers, and policymakers is crucial to create a food system that respects both environmental and agricultural needs.	4
We should aim to significantly increase the share of organic and sustainable farming in our food production to protect biodiversity and public health.	6
Public discourse on food systems must prioritize human health and economic stability over environmental concerns that may not have immediate local impacts.	4

Local, sustainable agricultural practices are crucial for adapting to the realities of climate change.	1
Investment in innovative agricultural technologies is essential for adapting to climate challenges and ensuring food security.	5
Local, sustainable agricultural practices are crucial for adapting to the realities of climate change.	1
Raising consumer awareness about the environmental impacts of food choices can drive demand for local and environmentally-friendly products.	7
We need to transition towards more sustainable food consumption patterns to address the realities of climate change.	1
It is essential to recognize that climate change poses a significant threat to our food security in Switzerland.	1
Public awareness of the climate crisis and its connection to food systems is vital for creating sustainable dietary habits.	1
Local, sustainable agricultural practices are crucial for adapting to the realities of climate change.	1
The reality of climate change necessitates a shift in agricultural practices without compromising productivity.	1
A significant shift toward plant-based diets is necessary to meet environmental and health goals.	0
It is crucial for Swiss farmers to manage their use of pesticides and fertilizers to minimize harmful effects on both biodiversity and water quality.	4
The government should not intervene excessively in agriculture, allowing market forces to shape the industry.	6
Local, organic food production must be supported to enhance food sovereignty and reduce reliance on imports.	0
The balance between environmental considerations and food production is crucial; without it, the sustainability of the Swiss food system may be compromised.	5
Government support for farmers should ensure fair prices and foster innovation in sustainable agriculture methods.	5
We need to increase public investment in sustainable agriculture practices to ensure food security for future generations.	7
The public should not be forced to adopt dietary restrictions; consumer choice should drive sustainable practices.	1
The reliance on foreign agricultural inputs raises concerns about the long-term sustainability of Switzerland's food system.	3
Local food production should be encouraged as a means to reduce carbon footprints without compromising the economic viability of farmers.	4

Investing in sustainable agricultural practices will enhance resilience against climate change and biodiversity loss.	7
The reliance on foreign agricultural inputs raises concerns about the long-term sustainability of Switzerland's food system.	3
Sustainable agricultural practices must be implemented to mitigate harmful effects on our water systems and to reduce the biodiversity crisis.	4
Increasing the self-sufficiency of the domestic food supply is essential, but it must not lead to overregulation of the agricultural sector.	0
It is essential to focus on reducing greenhouse gas emissions from our agricultural practices to combat climate change effectively.	1
The excessive use of fertilizers and pesticides in conventional farming leads to significant pollution and threatens biodiversity.	4
Swiss farmers should be encouraged to adopt more sustainable practices without facing excessive regulation.	5
We must avoid increasing pollution levels caused by intensive farming methods while ensuring the sustainability of our food system.	4
Public policies should support farmers by ensuring fair prices and minimizing the bureaucratic burden of environmental regulations.	7
Local, sustainable agricultural practices are crucial for adapting to the realities of climate change.	1
Government policies should incentivize the consumption of seasonal and regional products to promote sustainability.	7
Government regulations concerning food imports need to ensure that they do not compromise the quality of local Swiss products.	7
Global climate change requires local solutions, but these must be economically viable for farmers and consumers alike.	1
We should prioritize the cultivation of crops for human consumption over animal feed to reduce environmental impacts and enhance food sustainability.	4
The Swiss food system can thrive by embracing international trade and reducing protectionist measures.	6
Each individual should consider the environmental impact of their food choices and support local agriculture.	2
Our food systems must prioritize resilience to climate change to ensure future food security in Switzerland.	1
Investments in sustainable agricultural practices can enhance both food security and environmental health.	3
Government regulations on farming should not hinder the existing agricultural systems that already balance productivity and ecological health.	4

We need to transition towards more sustainable food consumption patterns to address the realities of climate change.	1
The over-reliance on synthetic fertilizers and pesticides should be reduced to promote healthier ecosystems and food systems.	5
Public awareness campaigns are essential to help consumers make informed choices that support sustainable food systems both locally and globally.	6
